

# addressable affray alarm

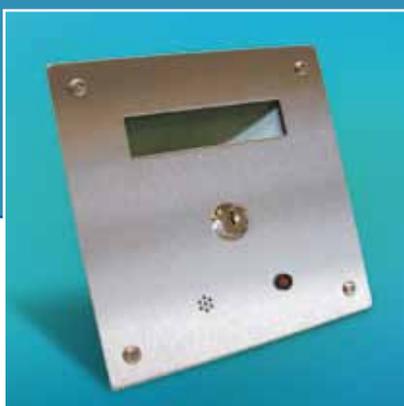

## for courtrooms

The Cell Call and Affray Alarm System has been developed specifically as a call system within police custody units as well as Crown Magistrates and County Courts. The system consists of a range of "panic" or "affray" buttons or "strips" which report back to the central LCD displays to sound the alarm and show the calling location where assistance is required.

There are a range of calling devices, triggers and buttons to generate an alarm, all of which can be configured for 5 different levels of status either "Call", "Assistance", "Priority", "Emergency", "Attack".

The call system records all historic system events by logging all system activity including date and time into the built in data logger located in the power supply. All units can either be constructed from stainless steel or ABS plastic mount. Plates can be monitored to prevent unauthorised access or tampering and the system is continually monitored for cable faults, system operation and power failure.

A custom graphical software package is also available providing a clear image of the location where assistance is required, allowing staff to provide a speedy response to any call.

**Affray LCD Display** – Provides audible visual indication of incoming calls, together with the system status indication. Two line backlit LCD identifies the location and status of incoming calls, system status such as tampers, unit failures and power supply faults. Calls can be reset with either a key or button reset.

**L7322 Affray Button L7422 Affray Interface** – A robust, reliable, simple to use call button with an integral red reassurance LED. A protection shroud prevents accidental activation. Each unit acts as a call point, with its own corresponding text location programmed into the system. During commissioning units can be programmed to generate different levels of call including "call", "affray alarm", "code blue", "general alarm" or "pegging point".

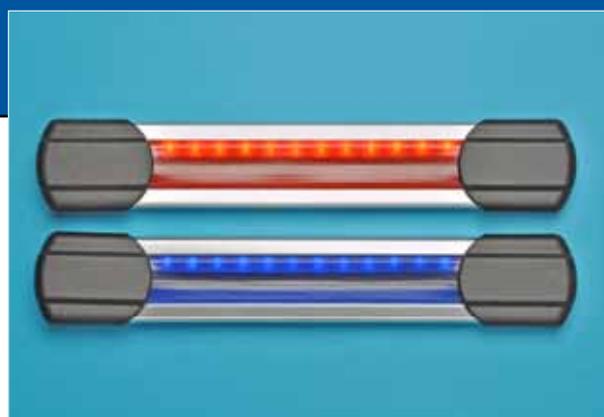

**Guardian Infra Red Triggers & Receivers** – Easy to operate personal infra red triggers can activate two levels of call "CALL" and "ATTACK", this enables the user to summon assistance at the touch of a button without leaving the scene or raise an attack call by pulling out the trigger's retaining clip. Receiver units should be suitably located throughout the area to be covered.

**Graphical Display** – Custom graphics can be prepared using our YAAM software. The graphics provide staff with a clear image where assistance is required within the building at a glance of an eye. YAAM software is able to use a range of sounds and colours to distinguish the various levels of alert to help staff access the priority of active events.

**Usher System** – This simple but practical light system allows the court room judge or magistrate to indicate to an usher that they are ready to enter the court room. The usher will notice a green LED flashing, if the court room is ready to receive the judge the usher can respond back by pressing the “enter” button. If the usher does not push the “enter” button the flashing LED drops out after 60 seconds.

**External Devices** – many 3<sup>rd</sup> party external buttons, pushes and strip alarms can be interfaced to enhance the range. An addressable “attack” module is required to provide the corresponding text location on the LCD Displays.

## system features

<b>data logging as standard</b>	all system events are recorded within the internal memory of the PSU and can be viewed via a web browser.
<b>individual text locations</b>	a fully programmable system that instantly sounds & displays custom text from calling locations
<b>multi level alarms</b>	different levels of alarms to distinguish calls using different sounds and colours
<b>IP integration</b>	full integration over LAN networks available
<b>cell call</b>	a complete range of speech and non speech Cell Call equipment is available meeting the latest prison service specifications
<b>affray alarm</b>	a full range of triggering devices, infra red, radio, panic strips and double push buttons
<b>interview rooms</b>	can be combined with panic buttons & room occupied system
<b>disabled WC alarms</b>	overdoor lights and pull cords can be added for a DDA compliant solution
<b>CCTV integration</b>	can be fully integrated with security systems & CCTV
<b>fault/tamper monitoring</b>	system is continuously monitored for cable & unit faults & unauthorised tamper
